

Executive Assistant for Enterprise Analytics

A first meeting with an EA is mostly about building a working relationship and learning how things run, so the invite should be short, warm, and make clear you're not asking for much of their time.

A few things I'd like to cover:

- How [Leader] prefers to schedule 1:1s and ad hoc time
- Key team meetings and planning cycles I should be aware of
- Travel/expense and other admin processes
- Anything I should have set up that I may have missed (DLs, team sites, etc.)

One tip: ask near the end, "What makes working with someone easy for you?" EAs rarely get asked that, and the answer will save you friction later.

Director of competitive intelligence

Here's an agenda for a 45-minute first conversation. It opens with learning about their work, moves to where you might help, and ends with one concrete next step. For an initial meeting with a CI leader, listening should take up most of the time.

1. Introductions (5 min)

- Your role and remit, and what you're working on
- Their background and how the CI function is set up at Insperity

2. The CI function today (10 min)

- Who CI serves: executive team, product, sales, pricing, marketing
- The questions leadership asks most often
- Main deliverables: battlecards, landscape reports, win/loss, pricing intel, exec briefings

3. Competitive landscape (10 min)

- Which competitors matter most right now. Likely ADP TotalSource, TriNet, Paychex, and Justworks, plus tech-led entrants like Rippling that bundle PEO with HRIS/payroll.
- Where Insperity wins and loses, and why
- Market shifts they're watching: AI in HR services, SMB buyer expectations, regulatory and benefits-cost pressure

4. Sources, tools, and workflow (10 min)

- Where intel comes from: field and sales input, public filings, pricing research, analyst reports, monitoring tools
- How it's stored, tagged, and shared, and how easily people can find it later
- Pain points: manual effort, stale content, inconsistent terms across teams, trouble linking intel to outcomes

5. Where we could work together (7 min)

- Connecting CI with enterprise analytics, such as tying competitive signals to win rates, churn, and pricing data
- A shared vocabulary or taxonomy for competitors, capabilities, and segments, so CI, product, and sales describe things the same way
- Responsible use of AI for monitoring and summarizing, with checks on accuracy and sources

6. Next steps (3 min)

- One small, high-value problem to look at together
- Key people or artifacts to review

- Cadence for staying in touch

Questions worth asking

- "If you could get one question answered faster or more reliably, what would it be?"
- "Where does good intel get lost between CI and the people who need it?"
- "How do you know when a CI deliverable actually changed a decision?"

Tips

- Keep section 5 exploratory. The first meeting should surface their problems. Save your architecture ideas for a follow-up, where you can bring them in response to what they told you.
- Ask up front whether there are limits on what they can share, since CI teams often handle sensitive material.

Director of Insights. An insights team usually sits where data, research, and decisions meet, so this agenda spends more time on how insights get produced, trusted, and acted on.

1. Introductions (5 min)

- Your role and focus areas
- Their background, team size, and where Insights sits in the org

2. The Insights mandate (10 min)

- Who the main consumers are: executives, product, sales, client services, HR service delivery
- What kinds of work they do: client and employee research, market sizing, satisfaction and retention analysis, dashboards and reporting
- The decisions their work most often shapes

3. How insights are produced (10 min)

- Data sources: client and worksite employee data, surveys, service interactions, CRM, and external market data
- Tools and platforms: BI, survey tools, data warehouse, any AI in use
- How they handle definitions. Do "client," "churn," and "active employee" mean the same thing everywhere?

4. Trust and impact (10 min)

- How leaders decide whether an insight is credible
- Where handoffs break down: slow access to data, conflicting numbers, one-off requests
- How they track whether an insight led to an action or outcome

5. Where we could work together (7 min)

- Shared metric definitions and a single source of truth for business rules, so Insights, analytics, and reporting agree
- Linking qualitative insight, such as survey data and client feedback, with operational and financial data
- Guardrails for AI-generated summaries and analysis, covering accuracy, traceability, and privacy for employee data

6. Next steps (3 min)

- One pilot question or dataset to explore together
- Key dashboards, reports, or people to review
- Follow-up cadence

Questions worth asking

- "Which insight do you wish leadership acted on more?"
- "Where do you spend time reconciling numbers instead of analyzing them?"
- "What's one question the business asks that you can't answer well today?"

Tip: If you're also meeting the Director of Competitive Intelligence, ask how Insights and CI work together. The gap between internal customer insight and external competitive intel is often where the most useful connections are, and you'd be positioned to help close it.

Director of Data & Analytics

1. Introductions (5 min)

- Your role and focus
- Their team, their platform ownership, and how they work with Insights and Competitive Intelligence

2. Their data landscape (10 min)

- Platforms: warehouse or lakehouse, dbt, BI tools, data catalog, graph stores, vector stores
- How meaning is managed today: glossary, catalog, a metric or semantic layer, or tribal knowledge
- Where AI is being applied, and what's blocking it: trust, access, grounding
- How new analytics questions get answered, and how long that takes

3. Pain points (5 min)

- Duplicate definitions, schema changes breaking reports, finding the right data, privacy reviews slowing access

4. Hero demo: the unified semantic layer (12 min)

- **Semantic map:** start on ClientCompany. It shows two source IDs resolved to one entity through GOV-007. Then click Jurisdiction: billing state looks like a match but only scores 0.60 as a closeMatch. Then click Account.Segment__c, a field every dashboard uses that has no meaning in the ontology.
- **Ask the fabric:** run four questions.
 - The first loads automatically.
 - The leave vs overtime question joins payroll, leave and CRM in place, then offers promotion to a planned metric.
 - The inclusion survey question is blocked by your ontology's anonymity shapes, and the fabric offers a safe team-level alternative.
 - The "quantum payroll module" question trips the circuit breaker instead of guessing.
- **Planned + on-demand:** one semantic layer, two paths, the same checks on both, and a queue for promoting recurring questions to planned metrics.

5. Where we could work together (8 min)

- A pilot on one domain, such as Client Relationship: map concepts to their real schemas and measure coverage
- Connecting the semantic layer to their catalog and dbt project rather than replacing them

6. Next steps (5 min)

- One domain and two or three source systems for a mapping pilot
- The right people: platform, catalog owner, privacy
- Follow-up with the Insights and CI directors, since all three demos share one semantic layer

Backup demo: drift sentinel. Use it if they ask "what happens when sources change?" or lean toward data operations.

- **Change A**, a CRM field rename, is graded MAJOR. The page traces the impact up four holon levels and out to LookML and cached answers, and proposes a remap.
- **Change B** is a harmless type change that is auto-approved.
- **Change C** is the strongest: a vendor adds an email column to an anonymous survey. It looks like a harmless additive change, but it breaks a privacy guarantee in your ontology and is quarantined before any query sees it.
- The coverage chart uses your real concept counts per domain.

Questions worth asking

- "When a source system changes a field, how do you find out, and how long does it take?"
- "If an AI agent answered a data question tomorrow, how would you know it was grounded?"
- "Which question do business teams ask you most that still takes a ticket?"

Things to know before the meeting

- **Real vs synthetic:** concept names, URIs, holon structure, rule IDs and privacy shapes come from your files. The source systems, field names, mapping scores, query plans and results are synthetic, and the page says so.
- **Mapping type names:** GOV-006 calls for six correspondence types but doesn't name them. The four SKOS relations plus derivedFrom and partOf are my proposal. Confirm them or give me your names before the meeting.
- **A point for this audience:** GOV-024 (zero graph latency) means on-demand graph queries are for analytics only, while transactions keep running on compiled policy. A data director will ask about performance, and this distinction answers it.
