Customer Advisor on Keel and North Star

Oct 23, 2026 · @jeffrey

Verdict

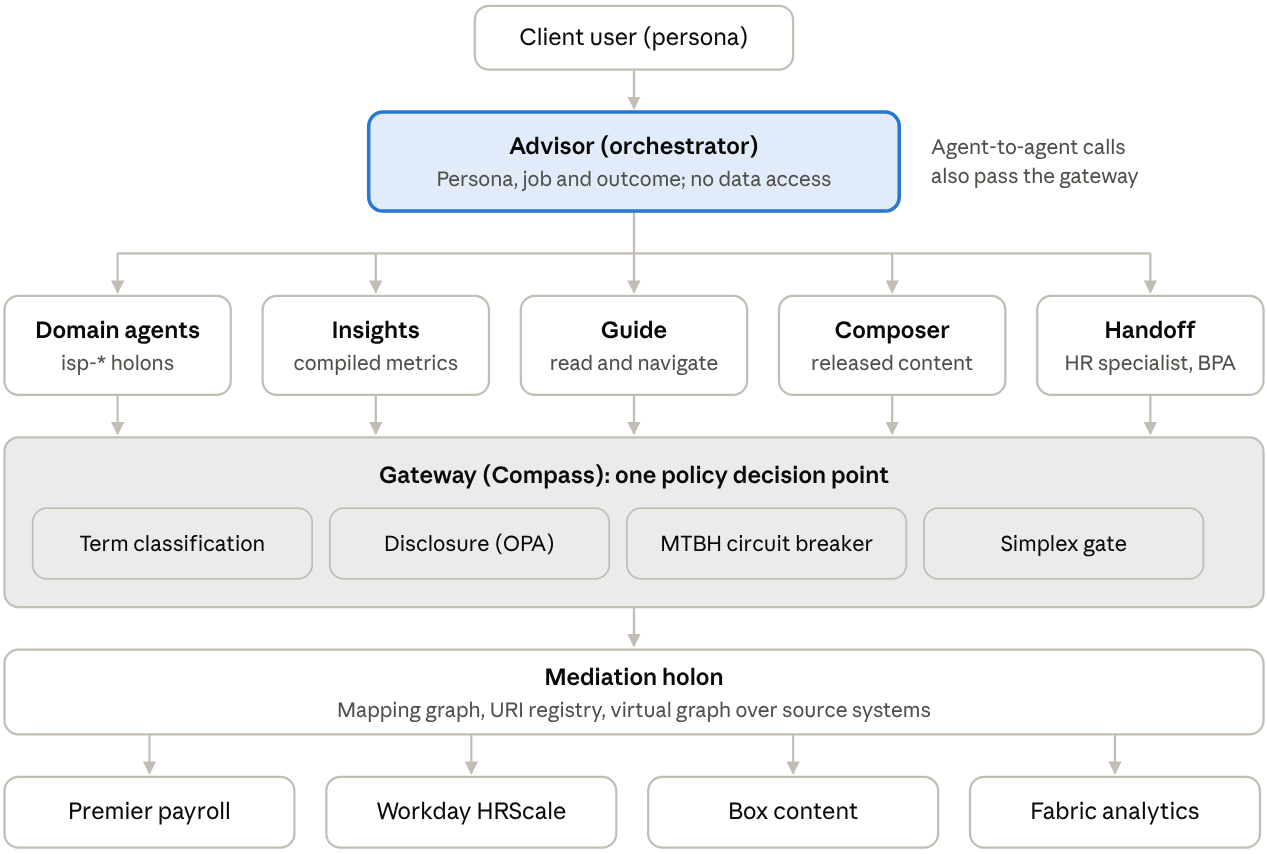

Yes, with conditions. Keel and North Star is the right base for a Customer Advisor, and a fabric of agents is the right shape. The architecture already assumes a fabric: one domain agent per holon, every agent registered with its own identity, and one gateway with no side doors.

The parts that make the advisor trustworthy are not built yet. Classification of terms inside content, disclosure rules, and controls on generated content are only partly specified today.

Why a fabric, not one agent

A fabric keeps each agent at least privilege, with the gateway as the only place decisions are made. A single advisor agent would need every permission across every client, the riskiest design for a multi-tenant PEO.

Every agent reaches source data only through one gateway

Customer Advisor fabric · 1 orchestrator, 5 agents, 1 gateway

The orchestrator delegates; only the gateway reaches source data, through the Mediation holon.

Agent	Job	What keeps it honest
Advisor (orchestrator)	Works out persona, job and desired outcome, then delegates	Owns the conversation; holds no data access
Domain agents (isp-pay, -ben, -comp, -tal, -tech)	Answer within their domain	Domain ontology plus compiled rules
Insights	Metrics, reports, benchmarks	Runs governed metric definitions as compiled SQL; the LLM never does the arithmetic

Agent	Job	What keeps it honest
Guide	Walks users through Premier and Workday HRScale	Read and navigate only; the Simplex gate holds any change
Composer	Writes the narrative report	Uses only content the gateway has released
Handoff	Routes to the HR specialist or BPA	Triggered when MTBH trips or a topic crosses the advice boundary

One rule must be explicit: agent-to-agent (A2A) calls pass the gateway too, not only agent-to-data calls. Otherwise the orchestrator becomes a confused deputy, passing data to someone who should not see it. Every agent acts on behalf of the signed-in user and never exceeds that user's entitlements.

Classification and disclosure are deterministic gateway services, not agents. Trust cannot depend on a model's judgment.

Running on top of the legacy estate

This is where the design is strongest: it overlays the existing systems rather than replacing them. The Mediation Holon (mapping graph, URI identity registry, lineage ingestion) and the hybrid graph pattern do the work.

- Slow-changing reference knowledge (rules, plans, definitions) is stored in the graph.
- Client and worker data stays in Premier, Workday, Box and Fabric, exposed as a virtual graph through R2RML or SQL/PGQ mappings. Nothing is copied.
- The eight ports keep Microsoft as the first set of adapters without making the knowledge depend on it.

The real cost is labeling existing content. Box documents and Fabric datasets must be classified before the advisor can draw on them; otherwise "admitted knowledge only" means almost nothing at launch.

Few personas, many outcomes

Build each job once and store desired outcomes as data. This fits the outcome-driven (ODI) benchmark already in progress.

- Jobs are shared across clients, so each job is built once.
- Outcomes vary, so each client gets an outcome profile (headcount band, states, industry, priorities), not its own agent.
- In the 5D context bundle, persona maps to WHO, job to WHAT, and outcome to WHY.

Open gap: peo-es.ttl has no Persona, Job or DesiredOutcome classes yet, so that module comes first.

Trust: the gaps to close

Five gaps stand between the current design and a client-facing advisor.

1. **A classification scheme bound to concepts, not keywords.** Mark sensitivity on ontology classes and properties: client-confidential, worker PII, sensitive PII (health, SSN, garnishments), Insperity-internal, legal-privileged, and possibly MNPI, since Insperity is publicly traded. A term found in content and anchored to a URI inherits its class. Named-entity recognition or regex is only a fallback for unanchored text.
2. **A disclosure policy model: who, what, when, why.** Express it as LKIF permissions and prohibitions, compiled to OPA. Co-employment matters: a client owner should not see a worker's medical leave reasons or benefit-plan health data. Timing rules matter too: effective dates, embargoes, open investigations, access after separation.
3. **Controls on generated content.** Output takes the highest classification of its inputs. For small clients the bigger risk is inference: a pay metric for a 12-person company can expose individuals. Enforce minimum cell sizes (My Seven Seas already uses groups of 5) and suppression on every aggregate, and stamp outputs with PROV-O lineage.
4. **An advice boundary.** The advisor informs; it does not give legal advice. Hiring guidance also brings in Illinois HB 3773 and NYC Local Law 144.
5. **A disclosure-specific evaluation set.** Red-team prompts such as "what does my manager earn?" or "which of my employees is on leave and why?" gate each phase, alongside MTBH and zero cross-tenant incidents.

Sequencing

Run the advisor internally before any client sees an unreviewed answer. The roadmap already puts client-facing North Star in Phases 2–3; keep it there.

1. Launch for service teams and BPAs, possibly through the HR Advisory 360 pilot, with a person reviewing every answer.

2. Use that phase to backfill content classification and build the disclosure evaluation set.
3. Open to clients once the evaluation set passes alongside the MTBH and cross-tenant gates.
